

7217/62593

established between said first apparatus and said second apparatus; and

transmitting, when communication is established between said first apparatus and said second apparatus, data stored in said second storage medium to said first storage medium based on said edited management information.

REMARKS

Claims 1-25 remain in the application and have been amended hereby.

As will be noted from the Declaration, Applicant is a citizen and resident of Japan and this application originated there.

Accordingly, the amendments made to the specification are provided to place the application in idiomatic English, and the claims are amended to place them in better condition for examination.

An early and favorable examination on the merits is earnestly solicited.

7217/62593

VERSION WITH MARKINGS TO SHOW CHANGES MADE

IN THE SPECIFICATION

Paragraph beginning on page 1, line 22 has been amended as follows:

As a portable audio-data playback apparatus, on the other hand, an apparatus using an optical disc or a magneto-optical disc with a diameter of about 64 mm has [been becoming] become popular in recent years. The portable audio-data playback apparatus converts an analog audio signal into a digital signal, compresses the digital signal by adoption of a compression technology known as ATRAC (Adaptive Transform Acoustic Coding: Trademark) and stores the compressed signal into a magneto-optical disc. The portable audio-data playback apparatus offers a merit of no deterioration of the sound quality caused by the operations to convert the analog audio signal into the digital signal, compress the digital signal and store the compressed signal. There is also another merit of a random playback operation due to the fact that a disc is used as a recording medium.

Paragraph beginning on page 2, line 22 has been amended as follows:

Also in the portable audio-data playback apparatus described above, once audio data has been recorded onto a magneto-optical disc, the playback operation is limited the range of the disc. That is to say, a random or general playback operation can not be carried out over a plurality of magneto-optical discs. It is thus necessary to replace a magneto-optical disc with [another severally] several other magneto-optical discs in order to carry out a random playback operation from a plurality of magneto-optical discs or an operation to play back specified pieces of music. As a result, the user must always take a plurality of magneto-optical discs or optical discs with the portable audio-data playback apparatus.

Paragraph beginning on page 4, line 4 has been amended as follows:

It has been further proposed [the] to use [of] a hard-disc drive or a semiconductor memory as a recording or storage medium in the portable audio-data playback apparatus described above. The music server described above may be

connected to the portable audio-data playback apparatus so that audio data stored in the music server can be transferred to the portable audio-data playback apparatus to be recorded or stored into the recording medium of the apparatus. Assume that the recording or storage capacity of the recording medium is 200 MB. In this case, it is no longer necessary for the user to carry a plurality of magneto-optical discs or optical discs. Of course, it is also unnecessary to replace a magneto-optical disc or an optical disc with another.

Paragraph beginning on page 8, line 15 has been amended as follows:

Fig. 8A shows a flowchart representing typical processes of a music server for processing to record musical data read out from a CD into a hard-disc drive at a high speed;

Paragraph beginning on page 8, line 19 has been amended as follows:

Fig. 8B shows a flowchart representing typical processes of an Internet server for processing to record musical data read out from a CD into a hard-disc drive at a high speed;

Paragraph beginning on page 12, line 2 has been amended as follows:

In the music server 50, musical data played back from the CD 55 is subjected to a compression-encoding process according to a predetermined technique such as the ATRAC method described earlier to produce compressed musical data, which is then recorded into the recording medium such as a hard disc. In the case of a hard disc with a storage capacity of 6 Gbyte, for example, about 1,000 pieces of music can be stored or recorded. A list of names of recorded or stored pieces of music is displayed typically on the display unit 53. The user is then capable of playing back any arbitrary piece of music selected from the list displayed on the display unit 53 to show the names of pieces of music recorded or stored in the hard disc. As a hard disc can be accessed at random, a large amount of musical data stored and recorded can be read out in arbitrary order and continuously played back by the music server 50.

Paragraph beginning on page 14, line 7 has been amended as follows:

The Internet server 60 also carries out a charging

process to compute a fee for a service rendered to the user of the music server 50. When musical data played back from the CD 55 is recorded into a recording medium at a high transfer speed as described above, the music server 50 informs the Internet server 60 that such a recording operation is carried out at a high transfer speed. The Internet server 60 then carries out processing to compute a recording fee to be charged to the user, allowing a CD to be selected or a piece of music to be selected from a CD and musical data to be recorded from the selected CD or the selected piece of music to be recorded from the CD at a high transfer speed.

Paragraph beginning on page 16, line 10 has been amended as follows:

In accordance with the aforementioned transmission method adopted by the present invention, transmitted musical data is recorded into a storage medium employed in a destination of transmission and remains in a storage medium of a source of transmission but is put in [an] a state of being irreproducible. This transmission operation is referred to as a move. By moving musical data in this way, a copy operation of musical data can be prevented from being carried out

without limitation.

Paragraph beginning on page 18, line 22 has been amended as follows:

The music server 50 may be provided with a WWW (World Wide Web) browser as an embedded application. By connecting the music server 50 provided with a WWW browser to the Internet server 60 using the communication line 61, the Internet can be searched for a variety of contents described typically in an HTML (Hypertext Markup Language) and any of the contents can then be displayed on the display unit 53.

Paragraph beginning on page 19, line 12 has been amended as follows:

By a communication between the music server 50 and the Internet server 60, the music server 50 can automatically acquire information such as the title of a CD 55 mounted on the music server 50 via the CD insertion unit 54 from the Internet server 60 through the communication line 61. Information such as a CD title acquired from the Internet server 60 is saved in the music server 50 and the saved information is displayed on the display unit 53 employed in

the music server 50 when necessary.

Paragraph beginning on page 23, line 21 has been amended as follows:

The input operation unit 1 comprises typically a plurality of push-type and rotary-type [key] operation keys and switches each actuated by an operation of any of these [key] operation keys. As an alternative, the input operation unit 1 may also be implemented by a rotary-push-type key known as a jog dial or a touch panel on the LCD. Of course, the input operation unit 1 may adopt a switch mechanism, which reacts to a press operation. A signal representing an operation carried out on the input operation unit 1 is supplied to the CPU 8 by way of the bus 40. The CPU 8 generates a control signal for controlling the operation of the music server 50 on the basis of the signal received from the input operation unit 1. The music server 50 operates in accordance with the control signal generated by the CPU 8.

Paragraph beginning on page 26, line 19 has been amended as follows:

It should be noted that the technique adopted by the

compression encoder 12 to change the compression speed is not limited to the method described above. For example, the compression speed can also be changed by switching the clock frequency of the compression encoder 12. As an alternative, the [2] two compression speeds are implemented by [2] two different pieces of hardware. As another alternative, musical data is compressed by the compression encoder 12 at the low processing speed by thinning the high-speed compression.

Paragraph beginning on page 30, line 7 has been amended as follows:

In a playback operation, musical data compressed and encoded by the compression encoder 12 and then recorded and stored in the HDD 10 is read out from the HDD 10 and supplied to a compression decoder 21 by way of the bus 40. The compression decoder 21 decodes and decompresses the compressed musical data read out from the HDD 10. The decoded and decompressed musical data is then supplied to a D/A converter 22 before being supplied to a terminal 24 by way of an amplifier 23. The data is then supplied to the speaker units 52L and 52R from the terminal 24 as music obtained as a result of the playback operation. It should be noted that, in the

case of a stereo system which is not shown in Fig. 2, there are [2] two routes from the D/A converter 22 to the terminal 24 by way of the amplifier 23. Of course, [2] two terminals 24 are provided in the stereo system.

Paragraph beginning on page 37, line 11 has been amended as follows:

The input operation unit 102 comprises typically a plurality of push-type and rotary-type [key] operation keys and switches each actuated by an operation of any of these [key] operation keys. As an alternative, the input operation unit 102 may also be implemented by a rotary-push-type key known as a jog dial or a touch panel on the LCD. Of course, the input operation unit 102 may adopt a mechanical switch mechanism, which reacts to a press operation. A signal representing an operation carried out on the input operation unit 102 is supplied to the CPU 105 by way of the bus 130. The CPU 105 generates a control signal for controlling the operation of the portable recording and playback apparatus 70 on the basis of the signal received from the input operation unit 102. The signal is generated by the input operation unit 102 to represent an operation carried out on an operation key

of the input operation unit 102. The operation of the portable recording and playback apparatus 70 is switched and controlled in accordance with the control signal generated by the CPU 105.

Paragraph beginning on page 41, line 2 has been amended as follows:

As part of pre-processing prior to an operation to record musical data into the hard disc of the HDD 106, the musical data supplied thereto is temporarily stored into an audio DRAM 107 connected to the bus 130. The musical data is then read back from the DRAM 107 and supplied to a compression encoder 108 through the bus 130. The compression encoder 108 carries out a compression-encoding process on the musical data by adoption of an encoding algorithm equivalent to the encoding algorithm adopted by the compression encoder 12 employed in the music server 50. The compressed musical data completing the compression-encoding process in the compression encoder 108 is again supplied to the DRAM 107 to be stored temporarily therein once more. Finally, the compressed musical data is read out from the DRAM 107 and recorded into the hard disc of the HDD 106.

Paragraph beginning on page 43, line 11 has been amended as follows:

In a playback operation, the compressed musical data is read out from the HDD 106 and supplied to a compression decoder 115 by way of the bus 130. The compression decoder 115 decodes and decompresses the compressed musical data read out from the HDD 106. The decoded and decompressed musical data is then supplied to a D/A converter 116 before being supplied to a terminal 118 by way of an amplifier 117. By mounting a headphone 72 on the terminal 118, the user is capable of enjoying the reproduced music. It should be noted that, in the case of a stereo system which is not shown in Fig. 5, there are provided [2] two routes from the D/A converter 116 to the terminal 118 by way of the amplifier 117 for left and right (L and R) channels respectively. Of course, [2] two terminals 118 are provided in the stereo system for the L and R channels respectively.

Paragraph beginning on page 47, line 19 has been amended as follows:

Next, the operation of the information communication system having the configuration described above is explained.

First of all, functions executed by the music server 50 as a standalone apparatus are described. Fig. 7 shows a flowchart representing typical processing carried out by the music server 50 to record musical data read out from the CD 55 mounted on the CD-ROM drive 9 onto a hard disc of the HDD 10.

Paragraph beginning on page 51, line 8 has been amended as follows:

At the step S22, the TOC information of the CD 55 mounted on the CD-ROM drive 9 of the music server 50 with the user ID corresponding to the music server 50 is output to the Internet server 60. The CD 55 is a CD, from which data is to be transferred from the [HDD 10] CD-ROM drive 9 of the music server 50 and to be recorded onto the hard disc of the HDD 10. The music server 50 also transmits high-speed-recording information indicating that high-speed recording is to be carried out to the Internet server 60 along with the TOC information.

Paragraph beginning on page 52, line 7 has been amended as follows:

At the next step S32, a charging process is carried out.

To put it in detail, a recording fee is computed from information such as the number of pieces of music to undergo the high-speed recording. The fee can then be drawn from a bank account specified by the user using the user's credit-card number corresponding to the user ID cataloged in advance. The fee charging method is not limited to such a technique. Another technique to charge a recording fee to the user, where the charging process is performed on the music server 50 side, is conceivable. For example, the music server 50 may be provided with a function to read a prepaid card. In this case, the computed recording fee is transmitted to the music server 50, which draws the fee from the prepaid card. The recording fee may also be [changed in dependent] charged depending on contents of the CD 55 under the control of the Internet server 60, which can be identified from the TOC information. It is also possible to prohibit an operation to record musical data read out from the CD 55 onto the hard disc of the HDD 10.

Paragraph beginning on page 53, line 17 has been amended as follows:

If the music server 50 confirms reception of the charging

information at the step [S3] S23 of the flowchart shown in Fig. 8A, the flow of the process goes on to a step S24 at which the charging information and other data are displayed on the display unit 53. At the next step S25, musical data is read out by the CD-ROM driver 9 from the CD 55 at a high speed and then subjected to a compression process in the compression encoder 12 also at a high compression speed. The compressed musical data output by the compression encoder 12 is then supplied to the HDD 10 to be stored onto the hard disc of the HDD 10. The step S25 corresponds to the step S15 of the flowchart shown in Fig. 7.

Paragraph beginning on page 59, line 8 has been amended as follows:

When pieces of compressed musical data are deleted from the HDD 106 automatically at the step S44, it is quite within the bounds of possibility that a piece of compressed musical data of importance to the user is erased from the HDD 106. In order to prevent a piece of compressed musical data of importance to the user from being erased, a warning message is displayed on the display unit 53 employed in the music server 50 or the LCD panel 120 of the portable recording and playback

apparatus 70. The warning message may notify the user that an operation to delete a piece of compressed musical data automatically from the HDD 106 will be carried out or may be a list of pieces of compressed musical data to be deleted. In this case, a piece of compressed musical data will be deleted only if the deletion is approved by the user. As another alternative, the user [itself] selects a piece of compressed musical data from those on a list displayed on the display unit 53 employed in the music server 50 or the LCD panel 120 of the portable recording and playback apparatus 70.

Paragraph beginning on page 73, line 3 has been amended as follows:

At the next step S51, the program file stored in the HDD 10 is searched for a list of programs with an ID of 300 by the CPU 8. The flow of the processing then goes on to a step S52 to form a judgment as to whether or not the program file includes such a list of programs. If the program file does not include such a list of programs, the flow of the processing goes on to a step S53 at which a new list of programs with an ID of 300 is created in the program file stored in the HDD 10. After the new list of programs is

7217/62593

created, the flow of the processing goes on to a step S54. If the program list includes such a list of programs, on the other hand, the flow of the processing goes on directly to the step S54. In this embodiment, when the program file does not include such a list of programs, a new list of programs is created in the program file stored in the HDD 10. However, it is also possible to adopt the following construction such that if the program list corresponding to the input ID of the apparatus 70 which can be transferred is created in advance in the HDD 10 of the music server 50, when the program list is not included in the program file as described above, transfer of the data may be prohibited as the CPU 8 makes a judgment that the transfer of the data to the apparatus 70 corresponding to the input ID is not permitted.

#### IN THE ABSTRACT OF THE DISCLOSURE

The original Abstract has been deleted and has been replaced as follows:

A communication system including a first apparatus having a first storage medium, and a second apparatus for transmitting data to the first apparatus. The second apparatus has a second storage medium for storing management

7217/62593

information of data to be transferred to the first storage medium, a communicator for communicating data with the first apparatus, an editor capable of editing the management information and a controller for making a control to transfer data stored in the second storage medium to the first storage medium by way of the communicator based on the management information edited by the editor.

IN THE CLAIMS

Claims 1-25 have been amended as follows.

--1. (Amended) A communication system including a first apparatus having a first storage medium, and a second apparatus for transmitting data to said first apparatus,

said second apparatus comprising:

a second storage medium for storing management information of data to be transferred to said first storage medium;

communication means for communicating data with said first apparatus;

edit means capable of editing said management information; and

control means for [making a control to] controlling transfer of data stored in said second storage medium to said first storage medium by way of said communication means based on [the basis of the] said management information edited by said edit means.

--2. (Amended) [A] The communication system according to claim 1, wherein said edit means is capable of editing said management information even [if] when communication is not established between said first apparatus and said second apparatus.

--3. (Amended) [A] The communication system according to claim 1, wherein said second apparatus further comprises:

display means having a first window for displaying data identification information based on said management information of said data to be transferred to said first storage medium, and a second window for displaying data identification information based on management information of said data stored in said second storage medium.

--4. (Amended) [A] The communication system according to claim 3, wherein said second apparatus further comprises[;]:

instruction means for selecting said data stored in said second storage medium and [making an instruction to give] assigning identification information indicating said first apparatus to said selected data; and

wherein said edit means edits said selected data based on [the basis] said [given] assigned identification information.

--5. (Amended) [A] The communication system according to claim 4, wherein said first window corresponds to said identification information indicating said first apparatus;

said instruction means [makes an instruction to give] assigns said identification information to said selected data by making an instruction to transfer said selected data to said first window; and

said edit means controls said second storage medium so that said second storage medium stores said identification information [corresponding] assigned to said selected data, said identification information being displayed on said first window.

--6. (Amended) [A] The communication system according to claim 5, wherein said second apparatus further comprises:

memory means capable of temporarily storing data; and

wherein said edit means controls said memory means so that said memory means stores said selected data and said identification information [corresponding] assigned to said selected data based on [the basis of the] said instruction by said instruction means.

--7. (Amended) [A] The communication system according to claim 5, wherein said display means displays said identification information [corresponding] assigned to said selected data on said first window based on [the basis of the] said instruction by said instruction means.

--8. (Amended) [A] The communication system according to claim 1, wherein said control means controls said second apparatus so that said second apparatus receives identification information of said first apparatus by way of said communication means; and

said control means [makes a control to] controls transfer of said data stored in said second storage medium to said

first storage medium by way of said communication means based on [the basis of] said identification information received by said second apparatus.

--9. (Amended) [A] The communication system according to claim 8, wherein said second storage medium stores identification information of a plurality of apparatuses; and

[if] when said identification information of said plurality of apparatuses stored in said second storage medium contains identification information received from said first storage medium, said control means [makes a control to permit] permits transmission of said data stored in said second storage medium to said first storage medium.

--10. (Amended) [A] The communication system according to claim 1, wherein said second apparatus further comprises:

transmission instructing means for giving a transmission instruction to said control means so that said control means [makes a control to] controls transfer of said data stored in said second storage medium to said first storage medium by way of said communication means based on [the basis of] said management information.

--11. (Amended) [A] The communication system according to claim 10, wherein said second apparatus further comprises:

judging means for making a judgment whether [or not] said first apparatus is mounted; and

wherein [if] when said control means receives a transmission instruction by said transmission instructing means and it is judged by said judging means that said first apparatus is mounted, said control means [makes a control to] controls transfer of said data stored in said second storage medium to said first storage medium by way of said communication means based on [the basis of] said management information.

--12. (Amended) [A] The communication system according to claim 1, wherein said second apparatus further comprises:

comparison means for comparing management information of data stored in said first storage medium with management information [which is] stored in said second storage medium [and which is provided for] of said data stored in said first storage medium; and

wherein said control means [makes a control to] controls transfer of said data from said second apparatus to said first

apparatus based on [the basis of said] a comparison result by  
said comparison means.

--13. (Amended) A communication apparatus for  
transmitting data to another apparatus having a first storage  
medium, comprising:

a second storage medium for storing management  
information of data stored in said first storage medium;

communication means for communicating data with said  
[another] other apparatus;

edit means capable of editing said management  
information; and

control means for [making a control to] controlling  
transfer of data stored in said second storage medium to said  
first storage medium by way of said communication means based  
on [the basis of the] said management information edited by  
said edit means.

--14. (Amended) [A] The communication apparatus according  
to claim 13, wherein said edit means is capable of editing  
said management information even [if] when communication is  
not established between said communication apparatus and said

[another] other apparatus.

--15. (Amended) [A] The communication apparatus according to claim 13, further comprising:

display means having a first window for displaying data identification information based on management information of data to be transferred to said first storage medium, and a second window for displaying data identification information based on management information of data stored in said second storage medium.

--16. (Amended) [A] The communication apparatus according to claim 15, further comprising[;]:

instruction means for selecting said data stored in said second storage medium and [making an instruction to give] assigning identification information indicating said [another] other apparatus to said selected data;

wherein said edit means edits said selected data based on [the basis] said [given] assigned identification information.

--17. (Amended) [A] The communication apparatus according to claim 16, wherein said first window corresponds to said

identification information indicating said [another] other apparatus;

said instruction means [makes an instruction to give] assigns said identification information to said selected data by making an instruction to transfer said selected data to said first window; and

said edit means controls said second storage medium so that said second storage medium stores said identification information [corresponding] assigned to said selected data, said identification information being displayed on said first window.

--18. (Amended) [A] The communication apparatus according to claim 17, further comprising:

memory means capable of temporarily storing data;

wherein said edit means controls said memory means so that said memory means stores said selected data and said identification information [corresponding] assigned to said selected data based on [the basis of the] said instruction by said instruction means.

--19. (Amended) [A] The communication apparatus according to claim 17, wherein said display means displays said identification information [corresponding] assigned to said selected data on said first window based on [the basis of the] said instruction by said instruction means.

--20. (Amended) [A] The communication apparatus according to claim 13, wherein said control means controls said communication apparatus so that said communication apparatus receives identification information of said [another] other apparatus by way of said communication means; and

said control means [makes a control to] controls transfer of said data stored in said second storage medium to said [another] other storage medium by way of said communication means based on [the basis of] said identification information received by said communication apparatus.

--21. (Amended) [A] The communication apparatus according to claim 20, wherein said second storage medium stores identification information of a plurality of apparatuses; and [if] when said identification information of said plurality of apparatuses stored in said second storage medium

contains identification information received from said first storage medium, said control means [makes a control to permit] permits transmission of said data stored in said second storage medium to said first storage medium.

--22. (Amended) [A] The communication apparatus according to claim 13, further comprising:

transmission instructing means for giving a transmission instruction to said control means so that said control means [makes a control to] controls transfer of said data stored in said second storage medium to said first storage medium by way of said communication means based on [the basis of] said management information.

--23. (Amended) [A] The communication apparatus according to claim 22, further comprising:

judging means for making a judgment whether [or not] said [another] other apparatus is mounted;

wherein [if] when said control means receives a transmission instruction by said transmission instructing means and it is judged by said judging means that said [another] other apparatus is mounted, said control means

[makes a control to] controls transfer of said data stored in said second storage medium to said first storage medium by way of said communication means based on [the basis of] said management information.

--24. (Amended) [A] The communication apparatus according to claim 13, further comprising:

comparison means for comparing management information of data stored in said first storage medium with said management information [which is] stored in said second storage medium [and which is provided for] of said data stored in said first storage medium; and

wherein said control means [makes a control to] controls transfer of said data from said communication apparatus to said [another] other apparatus based on [the basis of said] a comparison result by said comparison means.

--25. (Amended) A communication method for communicating a first apparatus having a first storage medium to a second apparatus for transmitting data to said first apparatus, said method comprising the steps of:

editing management information of data to be transferred

to said first apparatus, on said second storage medium of said second apparatus, irrespective of [the fact] whether [or not] communication is established between said first apparatus and said second apparatus; and

transmitting, when communication is established between said first apparatus and said second apparatus, data stored in said second storage medium to said first storage medium based on [the basis of] said edited management information.
